Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                        1 DB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    scaffold is constructed of two beta sheets, with the structures saffold is constructed of two beta sheets, with the structures al/S1/S4/S3 and S6/S5/S2/A2/A3. The beta strands are connected to each other via amino acid loops, where at least one of the loops binds to a receptor or antigen. The scaffold protein is used to stabilize antigens or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold may be bound to a protein which binds to a tumour antigen. This will target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the tumour cells. Therefore the scaffold protein may be used to target chemotherapeutic agents to specific cells. It may also be used to stabilize individual peptides in a peptide library and may be used in diagnostic techniques, and to stabilize antigens used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAY40727-Y40748 are functionally equivalent derivatives of the $4 peptide (AAY40607) which forms part of a scaffold protein. $4 is a beta strand peptide which forms part of a beta sheet. Peptides (AAY40601-Y40609) together form a single-chain scaffold protein which contains at least 1 disulfide bond, contains less than 10% alpha helix and contains at least 6 beta-strands. The scaffold protein is constructed of beta strands $1-$6, and may also include beta strands A1-A3, or any functionally equivalent derivative of these sequences. The beta strands form two beta sheets $1,54,53 and $5,85,52 with each strand connected to the next by hydrogen bonds, which generate a beta sandwich architecture. If the additional beta strands A1-A3 are included in the structure the

Gequences AAY40727-Y40748 are functionally equivalent derivatives of the CC 34 peptide (AAY40607) which forms part of a scaffold protein. S4 is a CC beta strand peptide which forms part of a beta sheet. Peptides (AAY40601-Y40609) together form a single-chain scaffold protein which CC contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 6 beta-strands. The scaffold protein is constructed of beta strands S1-S6, and may also include beta strands A1-A3, or any C functionally equivalent derivative of these sequences. The beta strands CC crom two beta sheets S1/S4/S3 and S6/S5/S2 with each strand connected to CC the next by hydrogen bonds, which generate a beta sandwich architecture. CC if the additional beta strands A1-A3 are included in the structure the scaffold is constructed of two beta sheets, with the structures the S2/S2/A2/A3. The beta strands are connected to each other via maino acid loops, where at least one of the loops binds to a corrector or antigen. The scaffold protein is used to stabilize antigens or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold cC may be bound to a protein which binds to a tumour antigen. This will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         õ

These scaffold proteins can used as a scaffold to bind antigen or receptor-binding fragments. To so be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rhematoid arthritis and diabetic retinopathy. Sequences AMAE9393-B39939 were used in the production of the proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the tumour cells. Therefore the scaffold protein may be used to target chemotherapeutic agents to specific cells. It may also be used to stabilize individual peptides in a peptide library and may be used in diagnostic techniques, and to stabilize antigens used as vaccines.
                                                                                                       based upon the human CTLA-4 SCA domain. These scaffold proteins can be used as a scaffold to bind antigen or receptor-binding fragments. These can be used in the treatment of diseases such as cancer, thrombosis, osteoporosis, rheumatoid arthritis and diabetic retinopathy. Sequences AAB29930-B29939 were used in the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; CTLA-4; scaffold protein; antigen-binding; receptor-binding; SCA domain; cancer; thrombosis; osteoporosis, rheumatoid arthritis; diabetic retinopathy; atheroscierosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                      Co of beta strands s1-56, and may also include beta strands A1-A3, or any control of the text by hydrogen bonds, which generate a beta strands connected to the next by hydrogen bonds, which generate a beta sandwich architecture. CI if the additional beta strands A1-A3 are included in the structure the cs scaffold is constructed of two beta sheets, with the structure the cs scaffold is constructed of two beta strands are connected to each cother via amino acid loops, where at least one of the loops binds to a creceptor or antigen. The scaffold protein is used to stabilize antigens cor whole proteins such as receptors, or their fragments. It may be used co hind two separate molecules. For example, one surface of the scaffold cmay be bound to a protein which binds to a tumour antigen. This will can be cytotoxic molecule or an autoimmune antibody which may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the company to the scaffold protein may be used to target chamour cells. Therefore the scaffold protein may be used to target communic against to specific cells. It may also be used to captabilize individual peptides in a peptide library and may be used in cc diagnostic techniques, and to stabilize antigens used as vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAY40727-Y40748 are functionally equivalent derivatives of the S4 peptide (AAY40607) which forms part of a scaffold protein. S4 is a beta strand peptide which forms part of a beta sheet. Peptides (AAY40607-Y40609) together form a single-chain scaffold protein which contains at least 1 disulfide bond, contains less than 10% alpha helix and contains at least 6 beta-strands. The scaffold protein is constructed and contains at least 6 beta-strands. The scaffold protein is constructed and contains at least 6 beta-strands. The scaffold protein is constructed and contains at least 6 beta-strands. The scaffold protein is constructed and contains at least 6 beta-strands.

                                                                                                                                                                                                                                                                                                                              The present invention is concerned with producing scaffold proteins based upon the human CTLA-4 SCA domain. These scaffold proteins used as a scaffold to bind antigen or receptor-binding fragments. 1 can be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rheumatoid arthritis and diabetic retinopathy. Sequences AMB2930-B93939 were used in the production of the proteins of the invention.

                                                                                                                                                                                                                                                                                                                        04-AUG-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence corresponds to a peptide (CDR-H1-7; AAY14403) derived from the sequence of the heavy chain variable region complementarity determining region (CDR)-1 of the anti-hepatitis C virus (HCV) Ser/Thr protease monocional antibody (MAb) 8D4 protein. The peptide has a Tyr to phe amino acid substitution at position 3 compared to the CDR-H1-7 peptide. The invention relates to the use of partial peptides (AAY14348-Y14353) from the MAb 8D4 for inhibiting HCV serine protease
                                                                                                                                                                                                                                                                                                                                               AAW31467;

Transcription can be activated without blocking other transcriptional activators. They probably act by interacting with a component of the RNA polymerase II holoenzyme, Galll, the strongest known yeast activator, which provides a more sensitive assay allowing detection of even weak which provides a more sensitive assay allowing detection of even weak
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          represent a fragment of a natural transcription activator. Perotein-protein interactions are identified in the assay by fusing a DNA-binding domain to a library of DNA fragments and introducing this and a fusion of target protein and a polypeptide containing a region of Gal4 which interacts with Gallip into a cell containing Gallip and identifying members of the library that interact with the target from activation of transcription. Such constructs are used to activate transcription in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           are fragments used in an assay to determine novel transcriptional activators. The method involves the production of transcriptional activators comprising of a DNA-binding group and a 6-25 amino acid peptide that is covalently bonded to the DNA binding group and does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapy, and in protein-protein interaction assays, does not inhibit

Amino acids at posns 2 and 3 can be any residue asp is preferred at posn 3. See also AAP82196-9.
                                                                  This peptide comprises an epitope tag that can be used in methods of the invention. The invention discloses a powerful new system for engineering antibody affinity and specificity, by constructing a microbial analogue of the mammalian system's B cell repertoire. Antibodies are displayed on the surface of yeast cells by genetic fusion with yeast cell wall proteins, especially agglutinin proteins. After mutation, variants are selected on the basis of improved binding characteristics with fluorescently labeled targets. The selection method also identifies proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Epitope tag; antibody engineering; yeast; surface display; protein library; peptide library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                    labeled targets. The selection meriod according that are with enhanced phenotypic characteristics, proteins that are displayed at higher levels, proteins that are secreted at higherlevels of improved stability.
                                                                                                                                                                                                                                                       Selecting proteins with enhanced phenotypic properties than wild-type proteins, is useful for highly specific cancer diagnosis
                                                                                                                                                                                                                                                                                                                                                                                     26-AUG-1998;

                                                                                                                               В
                                                                                                                                                                                                                                                                          CC The invention relates to a method for identifying compounds which CC inhibit internalization of cell surface receptors. Provided are an array CC of locations, each containing cells with a cell surface receptor CC protein, that are treated with a test compound. The protein is climinescently labeled or contacted with a luminescence produced is before or after test compound treatment. Any luminescence produced is converted into digital data and automatically analysed to determine if CC the test compound induced the protein internalization. The novel method is used to screen for compounds which modulate cell surface receptor CC protein internalization, this can be used in drug discovery, to test compound efficacy in living biological systems. The assay method is automated and compact. It has high throughput and uses smaller volumes of reagents and test compounds. Sequences Ax777704-718 represent examples of peptide epitope tags used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for selecting proteins with enhanced phenotypic properties relative to those of a wild-type, comprises transforming yeast cells with a vector expressing a protein to be tested fused to a yeast cell wall protein. The method is particularly useful for selecting antibodies for improved affinity and specificity. The present sequence is an epitope tag which is used in yeast cell surface display of proteins.

viability. Included in the invention is a computer readable storage medium comprising a programme which causes the method of the invention to be activated. The method is useful for cell state identification in cells. The method is also useful for drug discovery. An example of the invention relates to the use of inserted sequences and their ligands for high content screens incorporating dual labelled receptors. The present sequence represents an epitope tag used to label one end of a G-protein coupled receptor (GPCR). The intracellular and extracellular domains of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       G-protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                           This invention relates to a method for the automated measurement of viability. The method involves contacting cells with luminescent reporter molecules, imaging cells to get signals, and converting the signals into digital data which can be used as a measurement of cell signals into digital data which can be used as a measurement of cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AU5 epitope used

                                 endosomal system. The method comprises treating cells which possess a luminescently-tagged macromolecule, with a test compound, and obtaining luminescent signals from the cells. The signal is converted into digital data that is used to determine if the test compound has induced or inhibited the trafficking. The method can also be used to identify the extent of internalisation of membrane receptors, by fusing a labelled peptide epitope to the different domains of the receptor 9. the extracellular domain and intracellular domain. The present sequence is

CHLOROPLAST 50S RIBOSOMAL PROTEIN L10 BETA (FRAGMENT).
Spinacia oleracea (Spinach).
   Yamaguchi K., Subramanian A.R.;

Yamaguchi K., Subramanian A.R.;

"The plastid ribosomal proteins. Identification of all the proteins in the 50 s subunit of an organelle ribosome (chloroplast).";

J. Biol. Chem. 275:28466-28482(2000).

1- FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 23S KIBOSOMAL RNA.

1- SUBCELLULAR LOCATION: CHLOROPAST.

1- TISSUE SPECIFICITY: EXPRESSED IN ALL PLANT TISSUES.

1- MISCELLANEOUS: ON THE 2D-CEL ITS MM IS: 16.5 KDA.

1- MISCELLANEOUS: ON THE 2D-CEL ITS MM IS: 16.5 KDA.

1- MISCELLANEOUS: ON THE 2D-CEL ITS MM IS: 16.5 KDA.

1- SIMILARITY: BELONGS TO THE LIOP FAMILY OF RIBOSOMAL PROTEINS.

1- TISSUE SPECIFICITY SIDOSOMAL LIOP FAMILY OF RIBOSOMAL PROTEINS.

1- THEORY IPRO01790; Ribosomal_LIO_cub.

1- THEORY IPRO02363; RIBOSOMAL_LIO; PARTIAL.

1- PROSITE: PS01109; RIBOSOMAL_LIO; PARTIAL.

1- PROSITE: PS01109; RIBOSOMAL_LIO; PARTIAL.

1- PROSITE: PS01109; RIBOSOMAL_LIO; PARTIAL.

   CC S4 peptide (AAY40607) which forms part of a scaffold protein. S4 is a contains at least 1 disulfide bond, contains less than 10% alpha helix contains at least 1 disulfide bond, contains less than 10% alpha helix contains at least 1 disulfide bond, contains less than 10% alpha helix contains at least 6 beta-strands. The scaffold protein is constructed of beta strands S1-S6, and may also include beta strands A1-A3, or any contains less than 10% alpha helix conform two beta sheets S1/S4/S3 and S6/S5/S2 with each strands connected to form two beta sheets S1/S4/S3 and S6/S5/S2 with each strands connected to the next by hydrogen bonds, which generate a beta strands connected to constructed of two beta strands A1-A3 are included in the structure the constructed of two beta strands are included in the structure the content val amino acid loops, where at least one of the loops binds to a receptor or antigen. The scaffold protein is used to stabilize antigens cor whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold target the complex to tumour cells. Another surface may be bound to a protein which binds to a tumour antigen. This will the context be beta strands and the scaffold protein may be used to stabilize individual peptides in a peptide library and may be used to context to techniques, and to stabilize antigens used as vaccines.

  target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the tumour cells. Therefore the scaffold protein may be used to target chamotherapeutic agents to specific cells. It may also be used to stabilize individual peptides in a peptide library and may be used in diagnostic techniques, and to stabilize antigens used as vaccines.

XX CONTRIBET

XX CONTRI
   A method has been developed for the diagnosis of human rheumatoid cc arthritis (RA) using two-dimensional electrophoresis to generate a cc two-dimensional array of features. The method can be used for screening, cd diagnosis and prognosis of RA in a subject or for monitoring the effect comprises: (a) analysing a sample of serum or plasma and optionally cc synovial fluid by two-dimensional electrophoresis, to generate a two-cd feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the consent feature persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of the studies for testing drugs for therapy of RA, for purification of RA-cdiagnostic protein isoforms (RPIs), and for production of antibodies to compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy can AAV42103 represent expression reference protein isoform peptides, AAV42101 consent the exemplification of the prospective acid encoding RADFs can be used in the exemplification of the protecols. AAV4104 to AAV25068 represent degenerate probes for RPIs, which are then used in the exemplification of the present invention.

   Peptides AAR81847-54 are tryptic peptide fragments from human afamin (AAR81845) novel member of the human serum protein family. The fragments were used to design primers and probes (AAR00785-98) for the cloning of the afamin gene (AAR00785) from human liver CDNA. Afamin is thought to have similar properties to human albumin, alpha-foetoprotein and vitamin D binding protein due to homology with these proteins. The gene encodes a mature protein due to homology with these proteins. The protein given the protein given by a conventional processing). The protein was isolated from human plasma by a conventional chromatographic methods. The protein can be used to ameliorate ischaemia-reperfusion injury, rheumatoid arthritis, ARDS, cardiopulmonary bypass, sepsis, toxic niama substances are released after inflammation.

   arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the
   chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic protein isoforms (RPIs), and for production of antibodies to RPIs. The RA-diagnostic feature (RADP) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy protocols. ANY41844 to ANY42100 represent RPI peptides, ANY42101 to ANY42103 represent expression reference protein isoform peptides and ANZ25066 to ANZ25068 represent degenerate probes for RPIs, which are all used in the exemplification of the present invention.

  The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's disease. Associated Peatures (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIs) in cerebrospinal fluid, serum or plasma. The abundance of the AFS and APIs is then normalised to an Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFS and APIs correlates with the severity of Alzheimer's Disease. The present sequence is a peptide produced from an API by proteolysis.

   Ş
   The invention relates to a preparation comprising an isolated Bipolar CC Affected Disorder (BAD)-Associated Protein Isoform (DPIs). The DPI's are used to screen, diagnose or prognose of BAD or unipolar depression, identify a celebrate the stage or severity of BAD or unipolar depression, identify a celebrate that risk of developing BAD or unipolar depression, or monitor the celebrate that interact with a DPI. These agents, antibodies identify agents that interact with a DPI. These agents, antibodies celebrate the DPIs, and nucleic acids encoding the DPIs are used to treat CC against the DPIs, and nucleic acids encoding the DPIs are used to treat celebrate that disorder a schizoaffective disorder, a bipolar or a cumipolar affective disorder, a schizoaffective disorder, a bipolar or a CC unipolar affective disorder. The DPIs are used in proteomics. The DPI country approach of using DPIs for screening, diagnosis or prognosis of CC Expression analysis, such as not being able to obtain central nervous system (CNS) tissue from a living patient under normal circumstances.

CC The present sequence is a DIP decreased in the CSF (cerebro-spinal or individual care having man

C:Coll receptor beta chain V-D-J region (121-3BM) - mouse (fragment)
C:Species: Mus musculus (house mouse)
C:Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 30-May-1997
C:Accession: Pr0665
R:Feeney, A.J.
J. EXP. Med. 174, 115-124, 1991
A:Title: Junctional sequences of fetal T cell receptor beta chains have few N regions.
A:Reference number: Pr0665
A:Accession: Pr0665
A:Status: translation not shown
A:Molecule type: mRNA
A:Residues: 1-7 <FEE>
A:Experimental source: day 4 postnatal thymus, strain BALB/c
C:Keywords: T-cell receptor

   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

  Ş
  and contains at least 6 beta strands. The scaffold protein is constructed to functionally equivalent derivative of these sequences. The beta strands of form two beta sheets $1/$4/$3 and $6/$5/$2 with each strand connected to the maxt by hydrogen bonds, which generate a beta sandwich architecture. If the additional beta strands A1-A3 are included in the structure the graffold is constructed of two beta sheets, with the structures the graffold is constructed of two beta sheets, with the structures A1/$1/$4/$3 and $6/$5/$2/$2/$2/$3. The beta strands are connected to each other via maino acid loops, where at least one of the loops binds to a receptor or antigen. The scaffold protein is used to stabilize antigens or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold may be bound to a protein which binds to a tumour antigen. This will target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the computation of the scaffold protein may be used to target chemotherapeutic segents to appecific ceils. It may also be used in diagnostic techniques, and to stabilize antigens used as vaccines.

  CC (AA140001740007) together from a single contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 6 beta-strands. The scaffold protein is constructed CC of beta strands $1-$6, and may also include beta strands A1-A3, or any CC functionally equivalent derivative of these sequences. The beta strands CC form two beta sheets $1,54/$3 and $6,55/$2 with each strand connected to CC the next by hydrogen bonds, which genefate a beta sandwich architecture. CC If the additional beta strands A1-A3 are included in the structure the CC scaffold is constructed of two beta sheets, with the structure the CC scaffold is constructed of two beta sheets, with the structures CC energy and $6,55/$2/A2/A3. The beta strands are connected to each CC cother via amino acid loops, where at least one of the loops binds to a CC receptor or antigen. The scaffold protein is used to stabilize antigens CC or whole proteins such as receptors, or their fragments. It may be used CC may be bound to a protein which binds to a tumour antigen. This will CC target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the CC chemotherapeutic agents to specific cells. It may also be used to CC diagnostic techniques, and to stabilize antigens used as vaccines.

  This peptide is used as a universal transfer vector (UTV) sequence or as a spacer sequence in novel chimeric adenovirus coat proteins (CP), especially chimeric fibre proteins. It is modeled after fibronectin and exhibits heparin binding properties. Claimed UTVS/Spacers are given in AAW19810-11, AAW19813-25, AAW19827, AAW1988 AAW19831-32 and AAW19834-43). Claimed chimeric CPs differ from the wild-type CP by the introduction of the UTV and/or spacer at or near the C-terminus or in an exposed loop. This imparts on the chimeric CP the ability to bind to and enter cells by means of a novel cell surface binding site. Recombinant vectors comprising the chimeric CP are able to enter cells more efficiently than vectors comprising wild-type CP, especially at lower m.o.t. They are especially useful for gene therapy of e.g. cancers, genetic discovery descriptions.

The invention relates to screening, diagnosis or prognosis of Vascular pementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIs) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the specification. Detecting VD-associated features and VPI is useful for the specification.
   severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy.

The invention relates to a preparation comprising an isolated Bipolar Affected Disorder (BAD)-Associated Protein Isoform (DPIS). The DPI's are used to screen, diagnose or prognose of BAD or unipolar depression, identify a subject at risk of developing BAD or unipolar depression, or monitor the effect of therapy in a subject. They are also used to screen for or identify agents that interact with a DPI. These agents, antibodies against the DPIs, and nucleic acids encoding the DPIs are used to treat or prevent BAD or unipolar depression. Discasses that can be treated are attention deficient disorder, a schizoaffective disorder, a bipolar or a unipolar inffective disorder. The DPIS are used in proteomics. The

Sequences AAY40727-Y40748 are functionally equivalent derivatives of the CC S4 peptide (AAY40607) which forms part of a scaffold protein. S4 is a CC beta strand peptide which forms part of a beta sheet. Peptides CC (AAY40601-Y40609) together form a single-chain scaffold protein which CC contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 1 disulfide bond, contains less than 10% alpha helix CC form two beta strands S1-S6, and may also include beta strands A1-A3, or any CC functionally equivalent derivative of these sequences. The beta strands CC form two beta sheets S1/S4/S3 and S6/S5/S2 with each strand connected to CC the next by hydrogen bonds, which generate a beta sandwich architecture. CC If the additional beta strands A1-A3 are included in the structures can field is constructed of two beta sheets, with the structures CC A1/S1/S4/S3 and S6/S5/S2/A2/A3. The beta strands are connected to each CC or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold CC may be bound to a protein which binds to a tumour antigen. This will carget the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the

   This sequence corresponds to a peptide (CDR-H1-7; AAY14403) derived from the sequence of the heavy chain variable region complementarity determining region (CDR)-1 of the anti-hepatitis C virus (HCV) Ser/Thr protease monocional antibody (MAb) 8D4 protein. The peptide has a Tyr to Phe amino acid substitution at position 3 compared to the CDR-H1-7 peptide. The invention relates to the use of partial peptides (AAY14348-Y14353) from the MAb 8D4 for inhibiting HCV serine protease
  tumour cells. Therefore the scaffold protein may be used to target chemotherapeutic agents to specific cells. It may also be used to stabilize individual peptides in a peptide library and may be used diagnostic techniques, and to stabilize antigens used as vaccines.
  Sequence
   Neutralized antibody partial peptide derived from hepatitis C virus - useful for inhibiting Hepatitis C Virus (HCV) serine protease

   The present invention is concerned with producing scaffold proteins based upon the human CTLA-4 SCA domain. These scaffold proteins can be used as a scaffold to bind antigen or receptor-binding fragments. These can be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rhemmatoid arthritis and diabetic retinopathy. Sequences AAB29330-B2939 were used in the proteins of the invention.

   An oriented degenerate peptide library of the amino acid formula ARR79661 was constructed to isolate the amino acid sequences at the phosphorylation sites of a protein kinase eg. protein kinase A, cyclin B/p33(cdc2), src family kinases, etc. Peptides which are phosphorylated are isolated and their amino acid sequences are compared to known substrate/Inhibitor peptide sequences for that protein kinase. The peptides AAR79662-73 represent phosphorylation sites for protein kinase. A. This peptide sequence is the phosphorylation site in glycogen synthase site 2.

The isolated peptides can be used to screen cpds. for effects on the protein kinase activity, generate antibodies to identify native kinase substrates, or modulate a variety of cellular responses in which protein kinases are involved eg. cell cycle control, immune response, transcriptional activation or cell development.
   Sequence
   Determn of amino acid sequence of protein kinase phosphorylation site by phosphorylation of peptide library and sequencing phospho:peptide(s) formed, also new substrates and their analogues for modulating or detecting protein kinase

pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Genetics:
A;Genome: mitochondrion
C;Keywords: electron transfer; mitochondrion; oxidoreductase

A;Molecule type: protein
A;Molecule type: protein
A;Residues: 1-10 <LET2
C;Comment: Complex I, mitochondrial NADH-ubiquiquinone reductase, is the first of the
ranging from 5K to 75K.
C;Comment: This enzyme catalyzes electron transfer from endogenous NADH to ubiquinone
